genome polyprotein - hepatitis C virus (isolate JK5) (fragment)
N:Contains: core protein; envelope protein 1; nonstructural protein 2; NS1/E2 protein
C:Species: hepatitis C virus
A:Variety: isolate JK5
C:Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 17-Nov-2000
C:Accession: S19876
R:Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.
submitted to the EMBL Data Library, September 1991
A:Description: Sequence analysis of putative structural regions of Hepatitis C Virus iso
A:Reference number: S18029
A:Accession: S19876
```

 CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
 CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
 CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
 CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
 CC ACTIVATION OF NS3.
 CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
 CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
 CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position. Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
 CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 RL
 CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 precursor polyprotein, commonly with Asp or Glu in the P6
 position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 (RNA) (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 PROTEIN C AND MRNA.
 CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- SUBMIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.

XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX Claim 29; Page 67; 146pp; English.

XX AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 523-542 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

XX from HCV infection

XX Claim 4; Page 228; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosing the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

XX Novel composition comprising a hepatitis C virus antisense polynucleotide which is complementary to or corresponds to a sense strand of the virus genome, and selectively hybridizes to it -

XX Example; Fig 5; 75pp; English.

CC The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypeptide level to a HCV polypeptide. The antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.

XX Treating or preventing hepatitis C virus infection in a subject, involves administering hepatitis C virus envelope protein E2 binding agents -

PS Claim 5; Fig 8; 46pp; English.

XX The present sequence represents a water soluble variant of a Hepatitis C virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein (such as the human Eo protein), and so inhibit the attachment of HCV onto cells (especially liver cells), are used to treat HCV infections in mammals, in particular humans. The specification also describes a method for identifying a compound which can be used for treating or preventing HCV in a subject and which can inhibit the attachment of HCV onto cells by inhibiting the binding of HCV envelope E2 protein to a cellular protein associated with HCV attachment and entry into cells. The method comprises incubating the compound, HCV envelope E2 protein or its variant and a cellular protein capable of specifically binding to the HCV E2 protein under suitable reaction conditions; determining the interactions between HCV envelope E2 protein and cellular protein in the presence and absence of the compound; and comparing the interaction to identify a compound which can inhibit the attachment of HCV onto cells.

XX
PS Example; Pages 36-37; 48pp; English.
XX
CC Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
CC 600-720 were mapped with PRPSCAN analysis. Based on the EIA reactivity
CC of a panel of HCV positive sera, peptide AAR33184 was chosen as the
CC immunogen for the generation of monoclonal antibodies to HCV NS1.
CC Several individual oligos representing AAs 365-731 of HCV genome
CC were ligated and cloned as three separate EcoRI/BamHI subfragments
CC into the CKS fusion vector pJ0200. The sequences of these three
CC subfragments - pHCV80, pHCV77 and pHCV65 are in AAR33185-7.
CC Analysis showed that MABs H13C113 and H23C163 showed reactivity
CC pHCV80 and pHCV65.

XX New recombinant antigens representing distinct antigenic regions of
PT Hepatitis C virus (HCV) genome, useful for detection of antibodies and
PT antigens in body fluids of individuals exposed to HCV -
XX
XX Example 10; Column 137-142; 167pp; English.
XX
XX The present invention describes recombinant Hepatitis C virus (HCV)
CC antigens (I). (I) is useful as a reagent for the detection of antibodies
CC and antigen in body fluids from individuals exposed to HCV. The HCV
CC assay uses reliable and efficient reagents and methods to accurately
CC detect the presence of HCV antibodies in samples obtained from
CC individuals suspected of having HCV infection. AAF32218 to AAF32235,
CC AAB51371 to AAB51379 and AAB69001 to AAB69032 represent sequences used
CC in the exemplification of the present invention.

 PI WPI; 1993-117468/14.
 XX
 XX Immuno-reactive hepatitis C virus polypeptide compens. - contg.
 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates
 XX
 XX Disclosure; Fig 3; 106pp; English.
 XX
 CC The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

 XX
 XX Claim 29; Fig 4; 115pp; English.
 XX
 CC The invention relates to a virus-like particle for use as an immunogen,
 CC comprising a first hepatitis B virus surface antigen (HBsAg) and a
 CC chimeric antigen comprising a second HBsAg which is covalently linked to
 CC an hepatitis C virus (HCV) immunogenic polypeptide, where the first and
 CC the second HBsAg each comprise a substantially complete S domain.
 CC The virus-like particle is useful as immunogen and as vaccine.
 CC The present sequence is a chimeric antigen comprising HCV 661 E2
 CC envelope glycoprotein and HBsAg S domain encoded by plasmid
 CC pCMV-II-E2661-SAg.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC (RNA)(N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: OF
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 RT "The Taiwanese hepatitis C virus genome: sequence determination and
 mapping the 5' terminus of viral genomic and antigenomic RNA.";
 RL Virology 188:102-113(1992).
 CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC (RNA) (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 CC PROTEIN C AND MRNA.
 CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 CC -!- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.
 CC THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC
 CC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE
 CC SORTING OF HETEROGENEOUS CELL TYPES. E-CADHERIN IS A LIGAND FOR
 CC INTEGRIN ALPHA-E/BETA-7.
 CC -!- SUBUNIT: Homodimer.
 CC -!- SUBCELLULAR LOCATION: Type I membrane protein.
 CC -!- TISSUE SPECIFICITY: NON-NEURAL EPITHELIAL TISSUES.
 CC -!- DEVELOPMENTAL STAGE: APPEARS IN THE EMBRYONIC ECTODERM DURING
 CC GASTRULATION WHEN EPIDERMAL DIFFERENTIATION COMMENCES AND IT
 CC DISAPPEARS FROM THE NEURAL PLATE AREA UPON NEURAL INDUCTION.
 CC -!- SIMILARITY: Contains 5 cadherin domains.

XX PT assays of HCV

XX PS Claim 29; Page 67; 146pp; English.

XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

XX CC virus (HCV) E1 and E2 peptides used in competition studies. This

XX CC sequence represents a synthetic E2 peptide, and corresponds to residues

XX CC 547-566 of the E2 protein sequence. These sequences are useful for in

XX CC vitro monitoring of HCV disease, or prognosis of the response to

XX CC interferon treatment of patients suffering from HCV infection. These

XX CC sequences compete with the proteins produced by AAT12704-T12709 and

XX CC AAT12961-T12974, which are included in vectors for the production of

XX CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

XX CC isolated and purified by carrying out a disulphide bond cleavage, or a

XX CC reduction step with a disulphide bond cleavage agent, after lysis of

XX CC recombinant host cells. The constructs containing the purified HCV

XX CC envelope proteins can be used for vaccinating humans against HCV, for in

XX CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

XX CC for detecting one or more serological types of HCV present in a

XX CC biological sample. The constructs can also be immobilised on a solid

XX CC substrate and incorporated into a reversed phase hybridisation assay for

XX CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

XX PT recombinant hepatitis C virus (HCV) single or specific oligomeric

XX PT recombinant envelope protein E1 or E2, useful for immunizing humans

XX PT from HCV infection -

XX PS Claim 4; Page 229; 243pp; English.

XX CC The present invention relates to new therapeutic vaccine compositions for

XX CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

XX CC composition containing at least one purified recombinant HCV single or

XX CC specific oligomeric recombinant envelope proteins selected from an E1 and

XX CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

XX CC useful for inducing HCV-specific antibodies or for immunising humans

XX CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

XX CC vaccines or therapeutics, in HCV screening and confirmatory antibody

XX CC tests, for raising antibodies, in the preparation of medicament, and for

XX CC in vitro monitoring of HCV disease or prognosing the response to

XX CC treatment of patients suffering from HCV infection. The present sequence

XX CC is a peptide derived from the proteins of the invention.

New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a pathogen or cancer -

Example 2; Fig 26; 364pp; English.

The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polynucleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, oesophagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is a peptide derived from a parent protein used to construct a savine of the invention.

 PT useful for treating or preventing infections or pathologies caused by
 PT hepatitis C virus (HCV) or those linked to HCV infection -

XX Claim 26; SEQ ID 82; 61pp + sequence listing; English.

XX The invention relates to nucleic acids encoding polypeptides which are
 CC termed SID polypeptides (selected interacting domain). These polypeptides
 CC are the final products of a double selection method involving a first
 CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
 CC through a two-hybrid system, and a second selection step involving an
 CC alignment between the different polynucleotides selected at the first
 CC step. The activity of polypeptides of the invention may be described as,
 CC virucide, hepatotropic, antiinflammatory and antibacterial. The
 CC polypeptide, polynucleotide and compositions comprising them are useful
 CC for treating or preventing viral or a bacterial infection, specifically
 CC infections or pathologies caused by HCV, or those pathologies linked to
 CC HCV infection. These may include liver disease and liver cancer. The
 CC current sequence represents a HCV bait polypeptide.

CC Note: The sequence data for this patent is not represented in the
 CC specification, but is based on sequence information supplied by the
 CC European Patent Office.

 XX Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -
 XX
 PS Example; Fig 5; 75pp; English.
 XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polypeptide. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

 XX

CC This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
 CC protein. The invention relates to peptide analogues derived from HCV
 CC proteins, e.g. AA67417-W67426, which can be used for the determination
 CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
 CC contain one or more thioamide peptide bonds where at least one oxygen
 CC atom of the peptide bond is replaced by sulphur atom. The peptide
 CC analogues can be adsorbed or chemically bound to a carrier.

 PT New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 PT useful for treating hepatitis C virus infection and for providing
 PT immune protection against virus infection -
 XX
 PS Claim 4; Fig 6; 84pp; English.
 XX
 CC The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

PT Treating or preventing hepatitis C virus infection in a subject,
PT involves administering hepatitis C virus envelope protein E2 binding
PT agents -
XX
PS Claim 5; Fig 8; 46pp; English.
XX
CC The present sequence represents a water soluble variant of a Hepatitis C
CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
CC (such as the human E2 protein), and so inhibit the attachment of HCV onto
CC cells (especially liver cells), are used to treat HCV infections in
CC mammals, in particular humans. The specification also describes a method
CC for identifying a compound which can be used for treating or preventing
CC HCV in a subject and which can inhibit the attachment of HCV onto cells
CC by inhibiting the binding of HCV envelope E2 protein to a cellular
CC protein associated with HCV attachment and entry into cells. The method
CC comprises incubating the compound, HCV envelope E2 protein or its variant
CC and a cellular protein capable of specifically binding to the HCV E2
CC protein under suitable reaction conditions; determining the interactions
CC between HCV envelope E2 protein and cellular protein in the presence and
CC absence of the compound; and comparing the interaction to identify a
CC compound which can inhibit the attachment of HCV onto cells.

CC The present sequence is hepatitis C virus (HCV) E2-634 HVR1 construct
CC containing the endoplasmic reticulum signal sequence of envelope protein
CC E1 and carboxy-terminal truncated E2 protein lacking the hypervariable
CC region one (HVR1). The HCV E2 protein lacking HVR1 DNA is useful for
CC producing infectious HCV and chimeric HCV viruses which are useful for
CC for identifying cell lines capable of replicating the replication of
CC viruses. The infectious HCV and HVR1-chimeric HCV are used in the
CC production of attenuated or inactivated vaccines which are useful for
CC treating or preventing HCV in a mammal by immunisation. The host cells
CC expressing the H77C(HVR1) DNA is useful as an immunogen to stimulate a
CC protective immune response to HCV. The immunogens are useful for
CC producing protective antibodies to HCV. The antibodies produced are used
CC in passive immunoprophylaxis for treatment of diseases caused by HCV in
CC animals, especially humans. The H77C(HVR1) DNA is also useful in gene
CC therapy.
CC Note: The present sequence is not shown in the specification but is
CC derived from Hepatitis C virus envelope 2 protein lacking hypervariable
CC region 1 (AAE00442) referred as SEQ ID NO: 2 and shown in figure 1.

XX Immuno-reactive hepatitis C virus polypeptide compans. - contg.
XX at least 2 sequences from the first variable domain of distinct
XX HCV isolates
XX PS Disclosure; Fig 3; 106pp; English.
XX CC
XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
XX protein encoded by group I and group II HCV isolates, from amino acid
XX 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
XX interest. E2/NS1 contains an N-terminal hypervariable domain of about
XX 30 amino acids which shows large variation between nearly all isolates.
XX This is an important immunoreactive domain. This putative envelope
XX glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
XX virus) envelope polypeptide of the pestiviruses and the NS1 of the
XX flaviviruses, both of which confer protective immunity in hosts
XX vaccinated with these polypeptides. It has been discovered that a
XX number of important HCV epitopes vary among viral isolates and that
XX these epitopes can be mapped to specific domains. This meant that
XX immunologically cross-reactive polypeptides which focus on variable
XX rather than constant domains can be produced. See also AAQ39134-48
XX and AAR33982-91.

XX
CC This sequence comprises the conceptual translation product of
CC a hepatitis C virus E2 antigen expression cassette (AAT13899). The
CC encoded E2 antigen is truncated at amino acid residue 644 of HCV,
CC and contains an N-terminal sequence (SHEL) from human prourokinase
CC intended to promote signal protease processing, efficient secretion
CC and final product stability. Glycosylated E2 can be expressed in
CC mammalian host cells utilising claimed plasmid 577. Fusion
CC proteins produced by plasmid 577 are used in claimed assays and
CC test kits for detecting anti-analyte antibody as well as in claimed
CC vaccines for treatment of infection. The plasmid can be used to
CC produce high levels of proteins that would not normally be
CC expressed in mammalian cells due to the non-secretory nature of the
CC gene. The system is esp. used for expressing HCV proteins, allowing
CC proper processing, glycosylation and conformation of the viral
CC protein.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC	!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.			
CC	!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.			
CC	!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA) (N).			
CC	!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND RNA.			
CC	!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
CC ACTIVATION OF NS3.
CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC {RNA} (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 RT from Streptomyces lividans 66 and DNA sequence of the gene (abfa).";
 RL Biochem. J. 302:443-449(1994).
 CC -!- FUNCTION: Important role in the degradation of arabinose-
 CC containing hemicelluloses. Hydrolyzes rapidly the short-chain
 CC arabinoligosides from digestion of xylan with xylanases.
 CC Acts slowly on arabinan and arabinoxylan from wheat and rye flour
 CC to release L-arabinofuranose. Does not act on oat-spelts xylan or
 CC arabinogalactan.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of terminal non-reducing alpha-L-
 CC arabinofuranoside residues in alpha-L-arabinosides.
 CC -!- SUBUNIT: Oligomer.
 CC -!- SUBCELLULAR LOCATION: Cytoplasmic.
 CC -!- MISCELLANEOUS: Optimal enzyme activity occurs at 60 degrees
 CC Celsius and pH 6.0.
 CC -!- SIMILARITY: BELONGS TO FAMILY 51 OF GLYCOSYL HYDROLASES.

XX Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

XX proteins - in presence of disulphide bond cleavage agent, to

XX produce proteins suitable for direct use in vaccines or diagnostic

XX assays of HCV

XX Example 7; Page 67; 146pp; English.

PS AAR90965-P90980 and AAR90995-P91015 represent synthetic hepatitis C

XX virus (HCV) E1 and E2 peptides used in competition studies. This

XX sequence represents a synthetic E2 peptide, and corresponds to residues

XX 559-578 of the E2 protein sequence. These sequences are useful for in

XX vitro monitoring of HCV disease, or prognosis of the response to

XX interferon treatment of patients suffering from HCV infection. These

XX sequences compete with the proteins produced by AAT12704-T12709 and

XX AAT12961-T12974, which are included in vectors for the production of

XX recombinant E1, E2, and E1/E2. The recombinant proteins can then be

XX isolated and purified by carrying out a disulphide bond cleavage, or a

XX reduction step with a disulphide bond cleavage agent, after lysis of

XX recombinant host cells. The constructs containing the purified HCV

XX envelope proteins can be used for vaccinating humans against HCV, for in

XX vitro detection of HCV antibodies in a sample, and in a serotyping assay

XX for detecting one or more serological types of HCV present in a

XX biological sample. The constructs can also be immobilised on a solid

XX substrate and incorporated into a reversed phase hybridisation assay for

XX determining the presence or the genotype of HCV. The new-purification

XX method preserves the conformation of the recombinantly expressed E1, E2

XX and E1/E2, and eliminates contaminating proteins. Antigens isolated

XX using this method are more reactive with human sera than those isolated

XX by known techniques.

New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a pathogen or cancer -

Example 2; Fig 26; 364pp; English.

The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polynucleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, oesophagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is a peptide derived from a parent protein used to construct a savine of the invention.

XX New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 PT against a pathogen or cancer -

XX Example 2; Fig 26; 364pp; English.

XX The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a vaccine of the invention.

XX New selected interacting domain polypeptides and polynucleotides,
 PT useful for treating or preventing infections or pathologies caused by
 PT hepatitis C virus (HCV) or those linked to HCV infection -

XX Claim 26; SEQ ID 82; 61pp + sequence listing; English.

XX The invention relates to nucleic acids encoding polypeptides which are
 CC termed SID polypeptides (selected interacting domain). These polypeptides
 CC are the final products of a double selection method involving a first
 CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
 CC through a two-hybrid system, and a second selection step involving an
 CC alignment between the different polynucleotides selected at the first
 CC step. The activity of polypeptides of the invention may be described as,
 CC virucide, hepatotropic, antiinflammatory and antibacterial. The
 CC polypeptide, polynucleotide and compositions comprising them are useful
 CC for treating or preventing viral or a bacterial infection, specifically
 CC infections or pathologies caused by HCV, or those pathologies linked to
 CC HCV infection. These may include liver disease and liver cancer. The
 CC current sequence represents a HCV bait polypeptide.
 CC Note: The sequence data for this patent is not represented in the
 CC specification, but is based on sequence information supplied by the
 CC European Patent Office.

XX Immunoassays for Asiatic strains of hepatitis C virus - for
PT diagnosis of infection and screening blood supplies
XX Disclosure; Fig 17; 43pp; English.
XX
XX The present sequence is encoded by the consensus sequence of the coding
CC strand of a new hepatitis C virus (HCV), J1, NS1 domain. The J1 and J7
CC (also a new HCV isolate) isolates comprise sequences which are distinct
CC from the prototype HCV isolates, HCV1. The specification describes
CC immunoassays for HCV based on antigens from Asiatic strains not
CC cross-reactive with HCV-1. The assays are used for diagnosis of HCV
CC infection and to screen donated blood. The anti-HCV antibodies are also
CC useful therapeutically and prophylactically (passive immunisation); in
CC screening for antiviral agents; for isolation, purification and
CC identification of non-A, non-B hepatitis virus (e.g. by affinity
CC chromatography) and to raise anti-idiotypic antibodies (useful for
CC treatment or diagnosis and to determine immunogenic regions of the
CC HCV antigens).

PT Antigenic polypeptides from J1 and J7 hepatitis C virus isolates -
PT useful as immunoassay reagents, for raising antibodies and as
PT vaccine components
XX
PS Example 5; Fig 17; 44pp; English.
XX
CC This polypeptide comprises a non-structural domain 1 (NS1) region
CC of novel Japanese isolate J1 of hepatitis C virus (HCV), as deduced
CC from an amplified DNA clone (see AAK00446). The sequence shows homology
CC to prototype HCV-1. The invention provides new Japanese isolates,
CC J1 and J7, of HCV. The new isolates have nucleotide and amino acid
CC sequences which are distinct from the prototype HCV-1 isolate.
CC These differences can be exploited for use in diagnostics for
CC NANBH, recombinant protein production and vaccine development.
CC Claimed antigenic polypeptides (see AAW30583-87) can be used: (i) as
CC immunoassay reagents, or standards, to detect HCV antibodies, e.g.
CC for diagnosing infection or screening donated blood; (ii) to
CC generate specific antibodies (used for detecting the corresponding
CC polypeptide, to screen for antiviral agents, for virus isolation
CC and for passive immunisation); (iii) in protective or therapeutic
CC vaccines, and (iv) for isolation of non-A, non-B viruses.

XX
XX New selected interacting domain polypeptides and polynucleotides,
PT useful for treating or preventing infections or pathologies caused by
PT hepatitis C virus (HCV) or those linked to HCV infection -
XX
XX Claim 26; SEQ ID 81; 61pp + sequence listing; English.
XX
XX The invention relates to nucleic acids encoding polypeptides which are
CC termed SID polypeptides (selected interacting domain). These polypeptides
CC are the final products of a double selection method involving a first

CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
CC through a two-hybrid system, and a second selection step involving an
CC alignment between the different polynucleotides selected at the first
CC step. The activity of polypeptides of the invention may be described as,
CC virucide, hepatotropic, antiinflammatory and antibacterial. The
CC polypeptide, polynucleotide and compositions comprising them are useful
CC for treating or preventing viral or a bacterial infection, specifically
CC infections or pathologies caused by HCV, or those pathologies linked to
CC HCV infection. These may include liver disease and liver cancer. The
CC current sequence represents a HCV bait polypeptide.
CC Note: The sequence data for this patent is not represented in the
CC specification, but is based on sequence information supplied by the
CC European Patent Office.

XX
XX Novel composition comprising a hepatitis C virus antisense
PT polynucleotide which is complementary to or corresponds to a sense
PT strand of the virus genome, and selectively hybridises to it -
XX
XX Example; Fig 5; 75pp; English.
XX
XX The specification describes a pharmaceutical composition which
CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
CC HCV is characterized by a positive stranded RNA genome which has
CC 40% homology at the polypeptide level to a HCV polypeptide. The
CC antisense polynucleotide binds to cellular polynucleotides which
CC enhance and/or are required for viral infectivity, replicative
CC ability or chronicity. The antisense polynucleotides may also be
CC designed to bind with high specificity, to be of increased stability,
CC to be stable and to have low toxicity. The composition also comprises

CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX PT Determination of antibody in sample - uses peptide analog absorbed
 PT or chemically bound on carrier as antigen

XX PS Disclosure; Page 4; 13pp; Japanese.

XX CC This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
 CC protein. The invention relates to peptide analogues derived from HCV
 CC proteins, e.g. AAW67417-W67426, which can be used for the determination
 CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
 CC contain one or more thioamide peptide bonds where at least one oxygen
 CC atom of the peptide bond is replaced by sulphur atom. The peptide
 CC analogues can be adsorbed or chemically bound to a carrier.

XX FT New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 FT useful for treating hepatitis C virus infection and for providing
 FT immune protection against virus infection

XX PS Claim 4; Fig 6; 84pp; English.

XX CC The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

XX
XX Treating or preventing hepatitis C virus infection in a subject,
PT involves administering hepatitis C virus envelope protein E2 binding
PT agents
XX
XX Claim 5; Fig 8; 46pp; English.
XX
XX The present sequence represents a water soluble variant of a Hepatitis C
CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
CC cells (especially liver cells), are used to treat HCV infections in
CC mammals, in particular humans. The specification also describes a method
CC for identifying a compound which can be used for treating or preventing
CC HCV in a subject and which can inhibit the attachment of HCV onto cells
CC by inhibiting the binding of HCV envelope E2 protein to a cellular
CC protein associated with HCV attachment and entry into cells. The method
CC comprises incubating the compound, HCV envelope E2 protein or its variant
CC and a cellular protein capable of specifically binding to the HCV E2
CC protein under suitable reaction conditions; determining the interactions
CC between HCV envelope E2 protein and cellular protein in the presence and
CC absence of the compound; and comparing the interaction to identify a
CC compound which can inhibit the attachment of HCV onto cells.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 CC -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
 CC -!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
 CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
 CC -!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
 CC ACTIVATION OF NS3.
 CC -!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
 CC -!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
 CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: Nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
 CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

 CC -!- FUNCTION: This protein is essential to the cell-division process.
 CC It seems to assemble into a dynamic ring on the inner surface of
 CC the cytoplasmic membrane at the place where division will occur,
 CC and the formation of the ring is the signal for septation to
 CC begin. Binds to and hydrolyzes GTP (By similarity).
 CC -!- SUBUNIT: Aggregates to form a ring-like structure (By similarity).
 CC -!- DOMAIN: CONSISTS OF TWO GLOBULAR DOMAINS WITH A CONNECTING CORE
 CC HELIX.
 CC -!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.

 from Streptomyces lividans 66 and DNA sequence of the gene (abfa).";
 RL Biochem. J. 302:443-449(1994).
 CC -!- FUNCTION: Important role in the degradation of arabinose-
 CC containing hemicelluloses. Hydrolyzes rapidly the short-chain
 CC arabinio-oligosaccharides from digestion of xylan with xylanases.
 CC Acts slowly on arabinan and arabinoxylan from wheat and rye flour
 CC to release L-arabinofuranose. Does not act on oat-spelts xylan or
 CC arabinogalactan.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of terminal non-reducing alpha-L-
 CC arabinofuranoside residues in alpha-L-arabinosides.
 CC -!- SUBUNIT: Oligomer.
 CC -!- SUBCELLULAR LOCATION: Cytoplasmic.
 CC -!- MISCELLANEOUS: Optimal enzyme activity occurs at 60 degrees
 CC Celsius and pH 6.0.
 CC -!- SIMILARITY: BELONGS TO FAMILY 51 OF GLYCOSYL HYDROLASES.

CC This SWISS-PROT entry is copyright. It is produced through a collaboration

 of haemolysin from E. coli 2001.";
 RL FEBS Lett. 187:339-344(1985).
 CC -!- FUNCTION: Bacterial hemolysins are exotoxins that attack blood
 CC cell membranes and cause cell rupture by mechanisms not clearly
 CC defined.
 CC -!- SUBCELLULAR LOCATION: Secreted.
 CC -!- DOMAIN: The Gly-rich region is probably involved in binding
 CC calcium, which is required for target cell-binding or cytolytic
 CC activity.
 CC -!- DOMAIN: The three transmembrane domains are believed to be
 CC involved in pore formation by the cytotoxin.
 CC -!- PTM: Palmitoylated by hlyC. The toxin only becomes active when
 CC modified.
 CC -!- MISCELLANEOUS: The hemolysin of E.coli is produced predominantly
 CC by strains causing extraintestinal infections, such as those of
 CC the urinary tract.
 CC -!- SIMILARITY: BELONGS TO THE RTX PROKARYOTIC TOXIN FAMILY.

RL Submitted (APR-2001) to the EMBL/GenBank/DBJ databases.
CC -!- FUNCTION: THIS SUBUNIT CAN ALONE TRANSFORM AIR TO CAIR, BUT IN
ASSOCIATION WITH PURK, WHICH POSSESSES AN ATPASE ACTIVITY, AN
ENZYME COMPLEX IS PRODUCED WHICH IS CAPABLE OF CONVERTING AIR TO
CAIR EFFICIENTLY UNDER PHYSIOLOGICAL CONDITION (BY SIMILARITY).
CC -!- CATALYTIC ACTIVITY: 5-amino-1-(5-phospho-D-riboseyl)imidazole-4-
carboxylate = 5-amino-1-(5-phospho-D-riboseyl)imidazole + CO(2).
CC -!- PATHWAY: De novo purine biosynthesis; sixth step.
CC -!- SUBUNIT: Homooctamer (By similarity).
CC -!- SIMILARITY: TO OTHER BACTERIAL PURE, ALSO TO AIR CARBOXYLASE FROM
FUNGI.

CC -!- FUNCTION: This protein is essential to the cell-division process.
CC It seems to assemble into a dynamic ring on the inner surface of
CC the cytoplasmic membrane at the place where division will occur,
CC and the formation of the ring is the signal for septation to occur.
CC begin. Binds to and hydrolyzes GTP.
CC -!- SUBUNIT: Aggregates to form a ring-like structure.
CC -!- SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface
CC of the cytoplasmic membrane (by similarity).
CC -!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.

PT New therapeutic vaccine compositions comprising at least one purified recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans
 PT from HCV infection -
 PS Example 7; Page 229; 243pp; English.
 CC The present invention relates to new therapeutic vaccine compositions for
 CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a
 CC composition containing at least one purified recombinant HCV single or
 CC specific oligomeric recombinant envelope proteins selected from an E1 and
 CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
 CC useful for inducing HCV-specific antibodies or for immunising humans
 CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
 CC vaccines or therapeutics, in HCV screening and confirmatory antibody
 CC tests, for raising antibodies, in the preparation of medicament, and for
 CC in vitro monitoring of HCV disease or prognosing the response to
 CC treatment of patients suffering from HCV infection. The present sequence
 CC is a peptide derived from the proteins of the invention.

 XX Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope
 PT proteins - in presence of disulphide bond cleavage agent, to
 PT produce proteins suitable for direct use in vaccines or diagnostic
 PT assays of HCV
 XX
 PS Example 7; Page 67; 146pp; English.

CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C
 CC virus (HCV) E1 and E2 peptides used in competition studies. This
 CC sequence represents a synthetic E2 peptide, and corresponds to residues
 CC 571-590 of the E2 protein sequence. These sequences are useful for in
 CC vitro monitoring of HCV disease, or prognosis of the response to
 CC interferon treatment of patients suffering from HCV infection. These
 CC sequences compete with the proteins produced by AAT12704-T12709 and
 CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
 CC isolated and purified by carrying out a disulphide bond cleavage, or a
 CC reduction step with a disulphide bond cleavage agent, after lysis of
 CC recombinant host cells. The constructs containing the purified HCV
 CC envelope proteins can be used for vaccinating humans against HCV, for in
 CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
 CC for detecting one or more serological types of HCV present in a
 CC biological sample. The constructs can also be immobilised on a solid
 CC substrate and incorporated into a reversed phase hybridisation assay for
 CC determining the presence or the genotype of HCV. The new purification
 CC method preserves the conformation of the recombinantly expressed E1, E2
 CC and E1/E2, and eliminates contaminating proteins. Antigens isolated
 CC using this method are more reactive with human sera than those isolated
 CC by known techniques.

 DR
 XX New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 PT against a pathogen or cancer -
 XX
 PS Example 2; Fig 26; 364pp; English.

CC The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptides and

CC polynucleotides are referred to as a Savine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer. (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a savine of the invention.

XX Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -

PS Example; Fig 5; 75pp; English.

XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polypeptide. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be

CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX Disclosure; Page 4; 13pp; Japanese.

XX This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
 CC protein. The invention relates to peptide analogues derived from HCV
 CC proteins, e.g. AAW67417-W67426, which can be used for the determination
 CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
 CC contain one or more thioamide peptide bonds where at least one oxygen
 CC atom of the peptide bond is replaced by sulphur atom. The peptide
 CC analogues can be adsorbed or chemically bound to a carrier.

XX Treating or preventing hepatitis C virus infection in a subject,
PT involves administering hepatitis C virus envelope protein E2 binding
PT agents
XX
XX Claim 5; Fig 8; 46pp; English.
XX
XX The present sequence represents a water soluble variant of a Hepatitis C
XX virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
XX (such as the human Eo protein), and so inhibit the attachment of HCV onto
XX cells (especially liver cells), are used to treat HCV infections in
XX mammals, in particular humans. The specification also describes a method
XX for identifying a compound which can be used for treating or preventing
XX HCV in a subject and which can inhibit the attachment of HCV onto cells
XX by inhibiting the binding of HCV envelope E2 protein to a cellular
XX protein associated with HCV attachment and entry into cells. The method
XX comprises incubating the compound, HCV envelope E2 protein or its variant
XX and a cellular protein capable of specifically binding to the HCV E2
XX protein under suitable reaction conditions; determining the interactions
XX between HCV envelope E2 protein and cellular protein in the presence and
XX absence of the compound; and comparing the interaction to identify a
XX compound which can inhibit the attachment of HCV onto cells.

XX Novel composition comprising a hepatitis C virus antisense

PT polynucleotide which is complementary to or corresponds to a sense

PT strand of the virus genome, and selectively hybridises to it -

XX Example; Fig 2; 75pp; English.

XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polyprotein. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX Immuno-reactive hepatitis C virus polypeptide compans. - contg.

PT at least 2 sequences from the first variable domain of distinct

PT HCV isolates

XX Disclosure; Fig 3; 106pp; English.

XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53 (BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAR339134-48
 CC and AAR33982-91.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 CC -!- FUNCTION: This protein is essential to the cell-division process.
 CC It seems to assemble into a dynamic ring on the inner surface of
 CC the cytoplasmic membrane at the place where division will occur,
 CC and the formation of the ring is the signal for septation to
 CC begin. Binds to and hydrolyzes GTP (By similarity).
 CC -!- SUBUNIT: Aggregates to form a ring-like structure (By similarity).
 CC -!- DOMAIN: CONSISTS OF TWO GLOBULAR DOMAINS WITH A CONNECTING CORE
 CC HELIX.
 CC -!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.

 CC -!- FUNCTION: Bacterial hemolysins are exotoxins that attack blood
 CC cell membranes and cause cell rupture by mechanisms not clearly
 CC defined.
 CC -!- SUBCELLULAR LOCATION: Secreted.

CC -!- DOMAIN: The Gly-rich region is probably involved in binding
 CC calcium, which is required for target cell-binding or cytolytic
 CC activity.
 CC -!- DOMAIN: The three transmembrane domains are believed to be
 CC involved in pore formation by the cytotoxin.
 CC -!- PTM: Palmitoylated by hlyC. The toxin only becomes active when
 CC modified.
 CC -!- MISCELLANEOUS: The hemolysin of E.coli is produced predominantly
 CC by strains causing extraintestinal infections, such as those of
 CC the urinary tract.
 CC -!- SIMILARITY: BELONGS TO THE RTX PROKARYOTIC TOXIN FAMILY.

XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

XX PT proteins - in presence of disulphide bond cleavage agent, to

XX PT produce proteins suitable for direct use in vaccines or diagnostic

XX PT assays of HCV

XX PS Claim 29; Page 67; 146pp; English.

XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

XX CC virus (HCV) E1 and E2 peptides used in competition studies. This

XX CC sequence represents a synthetic E2 peptide, and corresponds to residues

XX CC 583-602 of the E2 protein sequence. These sequences are useful for in

XX CC vitro monitoring of HCV disease, or prognosis of the response to

XX CC interferon treatment of patients suffering from HCV infection. These

XX CC sequences compete with the proteins produced by AAT12704-T12709 and

XX CC AAT12961-T12974, which are included in vectors for the production of

XX CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

XX CC isolated and purified by carrying out a disulphide bond cleavage, or a

XX CC reduction step with a disulphide bond cleavage agent, after lysis of

XX CC recombinant host cells. The constructs containing the purified HCV

XX CC envelope proteins can be used for vaccinating humans against HCV, for in

XX CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

XX CC for detecting one or more serological types of HCV present in a

XX CC biological sample. The constructs can also be immobilised on a solid

XX CC substrate and incorporated into a reversed phase hybridisation assay for

XX CC determining the presence or the genotype of HCV. The new purification

XX CC method preserves the conformation of the recombinantly expressed E1, E2

XX CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT recombinant envelope protein E1 or E2, useful for immunizing humans

XX PT from HCV infection

XX PS Claim 4; Page 230; 243pp; English.

XX CC The present invention relates to new therapeutic vaccine compositions for

XX CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

XX CC composition containing at least one purified recombinant HCV single or

XX CC specific oligomeric recombinant envelope proteins selected from an E1 and

XX CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

XX CC useful for inducing HCV-specific antibodies or for immunising humans

XX CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

XX CC vaccines or therapeutics, in HCV screening and confirmatory antibody

XX CC tests, for raising antibodies, in the preparation of medicament, and for

XX CC in vitro monitoring of HCV disease or prognosing the response to

XX CC treatment of patients suffering from HCV infection. The present sequence

XX CC is a peptide derived from the proteins of the invention.

 XX Immunoassays for Asiatic strains of hepatitis C virus - for
 PT diagnosis of infection and screening blood supplies
 XX Disclosure; Fig 17; 43pp; English.
 XX The present sequence is encoded by the consensus sequence of the coding
 CC strand of a new hepatitis C virus (HCV), J1, NS1 domain. The J1 and J7
 CC (also a new HCV isolate) isolates comprise sequences which are distinct
 CC from the prototype HCV isolates, HCV1. The specification describes
 CC immunoassays for HCV based on antigens from Asiatic strains not
 CC cross-reactive with HCV-1. The assays are used for diagnosis of HCV
 CC infection and to screen donated blood. The anti-HCV antibodies are also
 CC useful therapeutically and prophylactically (passive immunisation); in
 CC screening for antiviral agents; for isolation, purification and
 CC identification of non-A, non-B hepatitis virus (e.g. by affinity
 CC chromatography) and to raise anti-idiotypic antibodies (useful for
 CC treatment or diagnosis and to determine immunogenic regions of the
 CC HCV antigens).

XX
XX Antigenic polypeptides from J1 and J7 hepatitis C virus isolates -
PT useful as immunoassay reagents, for raising antibodies and as
PT vaccine components
XX
XX Example 5; Fig 17; 44pp; English.
XX
XX This polypeptide comprises a non-structural domain 1 (NS1) region
CC of novel Japanese isolate J1 of hepatitis C virus (HCV), as deduced
CC from an amplified DNA clone (see AAX00446). The sequence shows homology
CC to prototype HCV-1. The invention provides new Japanese isolates,
CC J1 and J7, of HCV. The new isolates have nucleotide and amino acid
CC sequences which are distinct from the prototype HCV-1 isolate.
CC These differences can be exploited for use in diagnostics for
CC NANBH, recombinant protein production and vaccine development.
CC Claimed antigenic polypeptides (see AAX30583-87) can be used: (i) as
CC immunoassay reagents, or standards, to detect HCV antibodies, e.g.
CC for diagnosing infection or screening donated blood; (ii) to
CC generate specific antibodies (used for detecting the corresponding
CC polypeptide, to screen for antiviral agents, for virus isolation
CC and for passive immunisation); (iii) in protective or therapeutic
CC vaccines, and (iv) for isolation of non-A, non-B viruses.

XX
XX Novel composition comprising a hepatitis C virus antisense
PT polynucleotide which is complementary to or corresponds to a sense
PT strand of the virus genome, and selectively hybridises to it -
XX
XX Example; Fig 5; 75pp; English.
XX
XX The specification describes a pharmaceutical composition which
CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
CC HCV is characterized by a positive stranded RNA genome which has
CC 40% homology at the polypeptide level to a HCV polyprotein. The
CC antisense polynucleotide binds to cellular polynucleotides which
CC enhance and/or are required for viral infectivity, replicative
CC ability or chronicity. The antisense polynucleotides may also be
CC designed to bind with high specificity, to be of increased stability,
CC to be stable and to have low toxicity. The composition also comprises
CC an agent which causes viral RNA to be inactive. The composition
CC is used for preventing HCV replication in a system. The present
CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
CC course of the invention.

 XX Determination of antibody in sample - uses peptide analog absorbed
 PT or chemically bound on carrier as antigen
 XX
 XX
 XX Disclosure; Page 4; 13pp; Japanese.
 PS
 CC This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
 CC protein. The invention relates to peptide analogues derived from HCV
 CC proteins, e.g. AAW67417-W67426, which can be used for the determination
 CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
 CC contain one or more thioamide peptide bonds where at least one oxygen
 CC atom of the peptide bond is replaced by sulphur atom. The peptide
 CC analogues can be adsorbed or chemically bound to a carrier.

 XX Treating or preventing hepatitis C virus infection in a subject.
 XX
 PT involves administering hepatitis C virus envelope protein E2 binding
 PT agents -
 XX
 XX Claim 5; Fig 8; 46pp; English.
 PS
 CC The present sequence represents a water soluble variant of a Hepatitis C
 CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
 CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells
 CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant
 CC and a cellular protein capable of specifically binding to the HCV E2

CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

 DR
 XX Immuno-reactive hepatitis C virus polypeptide compsns. - contg.
 PT at least 2 sequences from the first variable domain of distinct
 PT HCV isolates
 PT
 XX Disclosure; Fig 3; 106pp; English.
 PS
 XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVDV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

 XX
 XX New recombinant antigens representing distinct antigenic regions of
 PT Hepatitis C virus (HCV) genome, useful for detection of antibodies and
 PT antigens in body fluids of individuals exposed to HCV
 XX
 XX Example 11; Column 141-144; 167pp; English.
 PS
 XX The present invention describes recombinant Hepatitis C virus (HCV)
 CC antigens (I). (I) is useful as a reagent for the detection of antibodies
 CC and antigen in body fluids from individuals exposed to HCV. The HCV
 CC assay uses reliable and efficient reagents and methods to accurately
 CC detect the presence of HCV antibodies in samples obtained from
 CC individuals suspected of having HCV infection. AAF32218 to AAF32235,
 CC AAB51371 to AAB51379 and AAB69001 to AAB69032 represent sequences used
 CC in the exemplification of the present invention.

 XX

PS Disclosure; fig 46; 235pp; English.
XX
CC The sequence is the peptide encoded by the hepatitis C virus
CC (HCV) cDNA insert in clone K9-1 (see AAN90335). The polypeptides
CC are used to diagnose HCV-induced NANBH, to raise antibodies for
CC immunoassay or treatment, or to produce vaccines.
CC The region shown overlaps the cDNA of AAN90327.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA}(N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RT from a human carrier: comparison with reported isolates for conserved

RT and divergent regions.";

RL J. Gen. Virol. 72:2697-2704(1991).

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE

CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral

CC precursor polyprotein, commonly with Asp or Glu in the P6

CC position, Cys or Thr in P1 and Ser or Ala in P1'.

CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate +

CC {RNA}(N).

CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A

CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF

CC PROTEIN C AND MRNA.

CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- FUNCTION: Catalyzes the transfer of a phosphate group to glutamate
CC to form glutamate 5-phosphate which rapidly cyclizes to 5-
CC oxoproline.
CC -!- CATALYTIC ACTIVITY: ATP + L-glutamate = ADP + L-glutamate 5-
CC phosphate.
CC -!- PATHWAY: Proline biosynthesis; first step.
CC -!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
```

```
CC -!- SIMILARITY: Belongs to the glutamate 5-kinase family.
CC -!- SIMILARITY: Contains 1 PUA domain.

 XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope
 PT proteins - in presence of disulphide bond cleavage agent, to
 PT produce proteins suitable for direct use in vaccines or diagnostic
 PT assays of HCV
 XX PS Claim 29; Page 67; 146pp; English.
 XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C
 CC virus (HCV) E1 and E2 peptides used in competition studies. This
 CC sequence represents a synthetic E2 peptide, and corresponds to residues
 CC 595-614 of the E2 protein sequence. These sequences are useful for in
 CC vitro monitoring of HCV disease, or prognosis of the response to
 CC interferon treatment of patients suffering from HCV infection. These
 CC sequences compete with the proteins produced by AAT12704-T12709 and
 CC AAT12961-T12974, which are included in vectors for the production of
 CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
 CC isolated and purified by carrying out a disulphide bond cleavage, or a
 CC reduction step with a disulphide bond cleavage agent, after lysis of
 CC recombinant host cells. The constructs containing the purified HCV
 CC envelope proteins can be used for vaccinating humans against HCV, for in
 CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
 CC for detecting one or more serological types of HCV present in a
 CC biological sample. The constructs can also be immobilised on a solid
 CC substrate and incorporated into a reversed phase hybridisation assay for
 CC determining the presence or the genotype of HCV. The new purification
 CC method preserves the conformation of the recombinantly expressed E1, E2
 CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated
 CC by known techniques.

 XX DR New therapeutic vaccine compositions comprising at least one purified
 PT recombinant hepatitis C virus (HCV) single or specific oligomeric
 PT recombinant envelope protein E1 or E2, useful for immunizing humans
 PT from HCV infection
 XX PS Claim 4; Page 230; 243pp; English.
 XX CC The present invention relates to new therapeutic vaccine compositions for
 CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a
 CC composition containing at least one purified recombinant HCV single or
 CC specific oligomeric recombinant envelope proteins selected from an E1 and
 CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
 CC useful for inducing HCV-specific antibodies or for immunising humans
 CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
 CC vaccines or therapeutics, in HCV screening and confirmatory antibody
 CC tests, for raising antibodies, in the preparation of medicament, and for
 CC in vitro monitoring of HCV disease or prognosing the response to
 CC treatment of patients suffering from HCV infection. The present sequence
 CC is a peptide derived from the proteins of the invention.

CC This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
CC protein. The invention relates to peptide analogues derived from HCV
CC proteins, e.g. AAW67417-W67426, which can be used for the determination
CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
CC contain one or more thioamide peptide bonds where at least one oxygen
CC atom of the peptide bond is replaced by sulphur atom. The peptide
XX analogues can be adsorbed or chemically bound to a carrier.

XX
XX
PS Claim 5; Fig 8; 46pp; English.
XX
XX
CC The present sequence represents a water soluble variant of a Hepatitis C
CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
CC cells (especially liver cells), are used to treat HCV infections in
CC mammals, in particular humans. The specification also describes a method
CC for identifying a compound which can be used for treating or preventing
CC HCV in a subject and which can inhibit the attachment of HCV onto cells
CC by inhibiting the binding of HCV envelope E2 protein to a cellular
CC protein associated with HCV attachment and entry into cells. The method
CC comprises incubating the compound, HCV envelope E2 protein or its variant
CC and a cellular protein capable of specifically binding to the HCV E2
CC protein under suitable reaction conditions; determining the interactions
CC between HCV envelope E2 protein and cellular protein in the presence and
CC absence of the compound; and comparing the interaction to identify a
CC compound which can inhibit the attachment of HCV onto cells.

XX PT New recombinant antigens representing distinct antigenic regions of
 PT Hepatitis C virus (HCV) genome, useful for detection of antibodies and
 PT antigens in body fluids of individuals exposed to HCV -

XX PS Example 11; Column 141-144; 167pp; English.

XX CC The present invention describes recombinant Hepatitis C virus (HCV)
 CC antigens (I). (I) is useful as a reagent for the detection of antibodies
 CC and antigen in body fluids from individuals exposed to HCV. The HCV
 CC assay uses reliable and efficient reagents and methods to accurately
 CC detect the presence of HCV antibodies in samples obtained from
 CC individuals suspected of having HCV infection. AAF32218 to AAF32235.
 CC AAB51371 to AAB51379 and AAB69001 to AAB69032 represent sequences used
 CC in the exemplification of the present invention.

XX Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -

XX Example; Fig 2; 75pp; English.

XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polyprotein. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX Immuno-reactive hepatitis C virus polypeptide compans. - contg.
 PT at least 2 sequences from the first variable domain of distinct

PT HCV isolates
 XX Disclosure; Fig 3; 106pp; English.
 PS
 CC The sequences given in AAR33992-002 represent a portion of the E2/NS1
 CC protein encoded by group I and group II HCV isolates, from amino acid
 CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
 CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
 CC 30 amino acids which shows large variation between nearly all isolates.
 CC This is an important immunoreactive domain. This putative envelope
 CC glycoprotein E2/NS1 may correspond to the gp53(BVNV)/gp55 (hog cholera
 CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
 CC flaviviruses, both of which confer protective immunity in hosts
 CC vaccinated with these polypeptides. It has been discovered that a
 CC number of important HCV epitopes vary among viral isolates and that
 CC these epitopes can be mapped to specific domains. This meant that
 CC immunologically cross-reactive polypeptides which focus on variable
 CC rather than constant domains can be produced. See also AAQ39134-48
 CC and AAR33982-91.

 PT comprising a second HBsAg covalently linked to hepatitis C immunogenic

PT polypeptide -
 XX Claim 29; Fig 4; 115pp; English.
 PS
 CC The invention relates to a virus-like particle for use as an immunogen,
 CC comprising a first hepatitis B virus surface antigen (HBsAg) and a
 CC chimeric antigen comprising a second HBsAg which is covalently linked to
 CC an hepatitis C virus (HCV) immunogenic polypeptide, where the first and
 CC the second HBsAg each comprise a substantially complete S domain.
 CC The virus-like particle is useful as immunogen and as vaccine.
 CC The present sequence is a chimeric antigen comprising HCV 661 E2
 CC envelope glycoprotein and HBsAg S domain encoded by plasmid
 CC pCMV-II-E2661-SAg.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

CC -1- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
CC -1- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
CC -1- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
CC ACTIVATION OF NS3.
CC -1- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
CC -1- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CC -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC {RNA}(N).
CC -1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
CC -1- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
CC -1- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
CC -1- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -|- CATALYTIC ACTIVITY: Two-stage endonucleolytic cleavage to
CC nucleoside 3'-phosphates and 3'-phosphooligonucleotides ending in
CC A-P or G-P with 2',3'-cyclic phosphate intermediates.
CC -|- MISCELLANEOUS: After treatment by base Asp-32 and Asp-45 partially
CC isomerise by succinimide rearrangement to form isospartyl
CC peptides.
CC -|- SIMILARITY: BELONGS TO THE RIBONUCLEASE U2 FAMILY.

 CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 CC PROTEIN C AND MRNA.
 CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

"Nucleotide sequence of the genomic RNA of hepatitis C virus isolated
from a human carrier: comparison with reported isolates for conserved
and divergent regions.";
J. Gen. Virol. 72:2697-2704(1991).
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
{RNA}(n).
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPID-PROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
-!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-c1 complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis (By similarity).
CC -!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or
b562) is low-potential and absorbs at about 562, and heme 2 (or BH
or b566) is high-potential and absorbs at about 566 (By
similarity).
CC -!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
cytochrome c1 and the Rieske protein (By similarity).
CC -!- SIMILARITY: Belongs to the cytochrome b family.

XX Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX Claim 29; Page 67; 146pp; English.

XX AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 607-626 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

PT from HCV infection

XX Claim 4; Page 230; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosis of the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

 XX
 PT New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 PT against a pathogen or cancer
 XX
 XX Example 2; Fig 26; 364pp; English.
 PS
 CC The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptides and
 CC polynucleotides are referred to as a vaccine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcus, Haemophilus,
 CC Salmonella, Streptococcus, Legionella and Mycobacterium) or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a vaccine of the invention.

 PT Monoclonal antibodies specific for hepatitis C virus E2-NS1
 PT antigen - useful for diagnosis and evaluation of HCV infections
 PT and in differentiation studies
 XX
 XX Example; Page 29; 48pp; English.
 PS
 CC Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
 CC 600-720 were mapped with PRPSCAN analysis. FAB dimers of IgG
 CC purified from sera of individuals seropositive for antibodies to HCV
 CC proteins were used as the primary antibody for the serological
 CC analysis. Based on the reactivity these sera in EIA, four AA
 CC sequences (AAR32418, R32420, AAR33182, R33183) were identified as
 CC immunogenic domains. Each of these four sequences and an additional
 CC sequence, which was the combination of the two most immunogenic
 CC sequences (AAR33184) were synthesised. Based on the EIA reactivity of
 CC a panel of HCV positive sera, peptide AAR33184 was chosen as the
 CC immunogen for the generation of monoclonal antibodies to HCV NS1.

 XX Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -
 XX
 XX Example; Fig 5; 75pp; English.
 PS
 XX The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The

CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polyprotein. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

XX PT Determination of antibody in sample - uses peptide analog absorbed
 XX or chemically bound on carrier as antigen

XX PS Disclosure; Page 4; 13pp; Japanese.

XX CC This sequence represents the Hepatitis C virus (HCV) nucleocapsid core
 CC protein. The invention relates to peptide analogues derived from HCV
 CC proteins, e.g. AAW67417-W67426, which can be used for the determination
 CC of anti-HCV antibodies in a sample. Preferably the peptide analogues
 CC contain one or more thioamide peptide bonds where at least one oxygen
 CC atom of the peptide bond is replaced by sulphur atom. The peptide
 CC analogues can be adsorbed or chemically bound to a carrier.

XX PT Treating or preventing hepatitis C virus infection in a subject,
 XX involves administering hepatitis C virus envelope protein E2 binding
 XX agents

XX PS Claim 5; Fig 8; 46pp; English.

XX CC The present sequence represents a water soluble variant of a Hepatitis C
 CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
 CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells
 CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant
 CC and a cellular protein capable of specifically binding to the HCV E2
 CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

 XX
 CC Glycoprotein E2/NS1 is derived from the second envelope protein or
 CC first non-structural protein encoded by the genome of HCV. The
 CC nucleic acid is extracted from the serum of the patient of hepatitis
 CC C. The serum is pref. mixed with transfer RNA (tRNA) as a carrier
 CC of virus RNA. As a technique of cloning cDNA from the nucleic acid,
 CC it is preferred to use polymerase chain reaction method. In the
 CC reaction, any commercially available random primers or synthesized
 CC DNA having a base sequence similar to that of primer AS1 may be used
 CC as a primer. Representative examples of sense primers include S1.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA} (N).

CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPID PROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

CC -!- FUNCTION: FORMATION OF PSEUDOURIDINE AT POSITION 55 IN THE
CC PSI GC LOOP OF TRANSFER RNAs (BY SIMILARITY).
CC -!- CATALYTIC ACTIVITY: Uracil + D-ribose 5-phosphate = pseudouridine
CC 5'-phosphate + H(2)O.
CC -!- SIMILARITY: BELONGS TO THE TRUB FAMILY OF PSEUDOURIDINE SYNTHASES.

CC -!- FUNCTION: Component of the ubiquinol-cytochrome c reductase

CC complex (complex III or cytochrome b-c1 complex), which is a

CC respiratory chain that generates an electrochemical potential

CC coupled to ATP synthesis (By similarity).

CC -!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or

CC b562) is low-potential and absorbs at about 562, and heme 2 (or BH

CC or b566) is high-potential and absorbs at about 566 (By

CC similarity).

CC -!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,

CC cytochrome c1 and the Rieske protein (By similarity).

CC -!- SIMILARITY: Belongs to the cytochrome b family.

XX PT Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope

PT proteins - in presence of disulphide bond cleavage agent, to

PT produce proteins suitable for direct use in vaccines or diagnostic

PT assays of HCV

XX PS Example 7; Page 67; 146pp; English.

XX CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C

CC virus (HCV) E1 and E2 peptides used in competition studies. This

CC sequence represents a synthetic E2 peptide, and corresponds to residues

CC 619-638 of the E2 protein sequence. These sequences are useful for in

CC vitro monitoring of HCV disease, or prognosis of the response to

CC interferon treatment of patients suffering from HCV infection. These

CC sequences compete with the proteins produced by AAT12704-T12709 and

CC AAT12961-T12974, which are included in vectors for the production of

CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be

CC isolated and purified by carrying out a disulphide bond cleavage, or a

CC reduction step with a disulphide bond cleavage agent, after lysis of

CC recombinant host cells. The constructs containing the purified HCV

CC envelope proteins can be used for vaccinating humans against HCV, for in

CC vitro detection of HCV antibodies in a sample, and in a serotyping assay

CC for detecting one or more serological types of HCV present in a

CC biological sample. The constructs can also be immobilised on a solid

CC substrate and incorporated into a reversed phase hybridisation assay for

CC determining the presence or the genotype of HCV. The new purification

CC method preserves the conformation of the recombinantly expressed E1, E2

CC and E1/E2, and eliminates contaminating proteins. Antigens isolated

XX CC using this method are more reactive with human sera than those isolated

CC by known techniques.

XX PT New therapeutic vaccine compositions comprising at least one purified

PT recombinant hepatitis C virus (HCV) single or specific oligomeric

PT recombinant envelope protein E1 or E2, useful for immunizing humans

PT from HCV infection

XX PS Example 7; Page 231; 243pp; English.

XX CC The present invention relates to new therapeutic vaccine compositions for

CC inducing hepatitis C virus (HCV)-specific antibodies, comprising a

CC composition containing at least one purified recombinant HCV single or

CC specific oligomeric recombinant envelope proteins selected from an E1 and

CC an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are

CC useful for inducing HCV-specific antibodies or for immunising humans

CC against HCV. The recombinant HCV E1 and/or E2 proteins are useful as

CC vaccines or therapeutics, in HCV screening and confirmatory antibody

CC tests, for raising antibodies, in the preparation of medicament, and for

CC in vitro monitoring of HCV disease or prognosis of the response to

CC treatment of patients suffering from HCV infection. The present sequence

CC is a peptide derived from the proteins of the invention.

 XX
 CC Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
 CC 600-720 were mapped with PEPSKAN analysis. FAB dimers of IgG
 CC purified from sera of individuals seropositive for antibodies to HCV
 CC proteins were used as the primary antibody for the serological
 CC analysis. Based on the reactivity these sera in EIA, four AA
 CC sequences (AAR32419,R32420,AAR33182,R33183) were identified as
 CC immunogenic domains. Each of these four sequences and an additional
 CC sequence, which was the combination of the two most immunogenic
 CC sequences (AAR33184) were synthesised. Based on the EIA reactivity of
 CC a panel of HCV positive sera, peptide AAR33184 was chosen as the
 CC immunogen for the generation of monoclonal antibodies to HCV NS1.

 PT Novel composition comprising a hepatitis C virus antisense
 PT polynucleotide which is complementary to or corresponds to a sense
 PT strand of the virus genome, and selectively hybridises to it -
 XX
 PS Example; Fig 5; 75pp; English.
 XX
 CC The specification describes a pharmaceutical composition which
 CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
 CC HCV is characterized by a positive stranded RNA genome which has
 CC 40% homology at the polypeptide level to a HCV polypeptide. The
 CC antisense polynucleotide binds to cellular polynucleotides which
 CC enhance and/or are required for viral infectivity, replicative
 CC ability or chronicity. The antisense polynucleotides may also be
 CC designed to bind with high specificity, to be of increased stability,
 CC to be stable and to have low toxicity. The composition also comprises
 CC an agent which causes viral RNA to be inactive. The composition
 CC is used for preventing HCV replication in a system. The present
 CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
 CC course of the invention.

 XX Claim 5; Fig 8; 46pp; English.
 PS
 XX The present sequence represents a water soluble variant of a Hepatitis C

CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto
 CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells
 CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant
 CC and a cellular protein capable of specifically binding to the HCV E2
 CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

XX Immuno-reactive hepatitis C virus polypeptide compans. - contg.
PT at least 2 sequences from the first variable domain of distinct
PT HCV isolates
XX
PS Disclosure; Fig 3; 106pp; English.
XX
XX The sequences given in AAR33992-002 represent a portion of the E2/NS1
CC protein encoded by group I and group II HCV isolates, from amino acid
CC 370-850. E2/NS1 are viral envelope proteins and are of immunogenic
CC interest. E2/NS1 contains an N-terminal hypervariable domain of about
CC 30 amino acids which shows large variation between nearly all isolates.
CC This is an important immunoreactive domain. This putative envelope
CC glycoprotein E2/NS1 may correspond to the gp33(BVDV)/gp55 (hog cholera
CC virus) envelope polypeptide of the pestiviruses and the NS1 of the
CC flaviviruses, both of which confer protective immunity in hosts
CC vaccinated with these polypeptides. It has been discovered that a
CC number of important HCV epitopes vary among viral isolates and that
CC these epitopes can be mapped to specific domains. This meant that
CC immunologically cross-reactive polypeptides which focus on variable
CC rather than constant domains can be produced. See also AAR339134-48
CC and AAR33982-91.

PT and in differentiation studies
XX
XX Example; Pages 31-34; 48pp; English.
XX
XX Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
CC 600-720 were mapped with PEPSCAN analysis. Based on the EIA reactivity
CC of a panel of HCV positive sera, peptide AAR33184 was chosen as the
CC immunogen for the generation of monoclonal antibodies to HCV NS1.
CC Several individual oligos representing AAs 165-731 of HCV genome
CC were ligated and cloned as three separate EcoRI/BamHI subfragments
CC into the CKS fusion vector pJ0200. The sequences of these three
CC subfragments - pHCV80, pHCV77 and pHCV65 are in AAR33185-7.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 RA Okamoto H., Okada S.-I., Sugiyama Y., Kurai K., Lizuka H.,
 RA Machida A., Miyakawa Y., Mayumi M.;
 RT "Nucleotide sequence of the genomic RNA of hepatitis C virus isolated
 RT from a human carrier: comparison with reported isolates for conserved
 RT and divergent regions".
 RL J. Gen. Virol. 72:2697-2704(1991).
 CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
 CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
 CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.
 CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC {RNA} (N).
 CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
 CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
 CC PROTEIN C AND MRNA.
 CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

193.925 Million cell updates/sec

Title: US-09-973-025-91

Perfect score: 20

Sequence: 1 ACNWTGPERCDLEDRSEL 20

Scoring table: OLIGO

Gapop 60.0 , Gapext 60.0

Searched: 127863 seqs, 47026705 residues

Word size : 0

Total number of hits satisfying chosen parameters: 127863

Minimum DB seq length: 0

Maximum DB seq length: 2000000000

Post-processing: Listing first 45 summaries

Database : SwissProt_41.*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC {RNA} (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Monoclonal antibodies specific for hepatitis C virus E2-NS1
 PT antigen - useful for diagnosis and evaluation of HCV infections
 PT and in differentiation studies

XX Example; Page 29; 48pp; English.

XX Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
 CC 600-720 were mapped with PEPSCAN analysis. FAB dimers of IgG
 CC purified from sera of individuals seropositive for antibodies to HCV
 CC proteins were used as the primary antibody for the serological
 CC analysis. Based on the reactivity these sera in EIA, four AA
 CC sequences (AAR32419, R32420, AAR33182, R33183) were identified as
 CC immunogenic domains. Each of these four sequences and an additional
 CC sequence, which was the combination of the two most immunogenic
 CC sequences (AAR33184) were synthesised. Based on the EIA reactivity of
 CC a panel of HCV positive sera, peptide AAR33184 was chosen as the
 CC immunogen for the generation of monoclonal antibodies to HCV NS1.

 XX
 XX New synthetic polypeptides having several different segments of at
 PT least one parent polypeptide linked together differently compared to
 PT the linkage in the parent polypeptide, for inducing immune response
 XX against a pathogen or cancer
 XX
 PS Example 2; Fig 26; 364pp; English.
 XX
 CC The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for
 CC designing the synthetic polypeptides. The synthetic polypeptides and
 CC polynucleotides are referred to as a Savine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, bone
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a savine of the invention.

 XX New anti-Hepatitis C virus (HCV) antibodies useful for in situ
 PT detection of HCV -
 PT
 XX Example 4; Page 9; 32pp; English.
 PS
 XX This sequence represents residues 641-673 of the hepatitis c virus (HCV)
 CC E2 protein. The invention relates to an antibody (Ab) or its derivative
 CC that specifically binds to the C-terminal region of the HCV E1 protein
 CC (amino acids (aa) 227-383) or the N-terminal region of the HCV E2 protein
 CC (aa 384-450). The Ab allows the in situ detection of HCV protein
 CC antigens. The Ab is used to detect the HCV E1 or E2 proteins in human
 CC peripheral blood cells or liver tissue. It may also be used to detect HCV
 CC in other tissue and fluid samples such as serum, plasma, saliva, mucus
 CC and sections or biopsies such as from skin.

PT assays of HCV

XX Example 7; Page 67; 146pp; English.

PS AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C virus (HCV) E1 and E2 peptides used in competition studies. This sequence represents a synthetic E2 peptide, and corresponds to residues 643-662 of the E2 protein sequence. These sequences are useful for in vitro monitoring of HCV disease, or prognosis of the response to interferon treatment of patients suffering from HCV infection. These sequences compete with the proteins produced by AAT12704-T12709 and AAT12961-T12974, which are included in vectors for the production of recombinant E1, E2, and E1/E2. The recombinant proteins can then be isolated and purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques.

DR New therapeutic vaccine compositions comprising at least one purified recombinant hepatitis C virus (HCV) single or specific oligomeric recombinant envelope protein E1 or E2, useful for immunizing humans from HCV infection

PT

XX

PS Example 7; Page 231; 243pp; English.

XX The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an E1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV E1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a peptide derived from the proteins of the invention.

DR Monoclonal antibodies specific for hepatitis C virus E2-NS1 antigen - useful for diagnosis and evaluation of HCV infections and in differentiation studies

XX Example; Page 30; 48pp; English.

XX Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs 600-720 were mapped with PEPSAN analysis. FAB dimers of Igg purified from sera of individuals seropositive for antibodies to HCV proteins were used as the primary antibody for the serological analysis. Based on the reactivity these sera in EIA, four AA sequences (AAR32419, R32420, AAR33182, R33183) were identified as immunogenic domains. Each of these four sequences and an additional sequence, which was the combination of the two most immunogenic sequences (AAR33184) were synthesised. Based on the EIA reactivity of a panel of HCV positive sera, peptide AAR33184 was chosen as the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 CC -1- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.
 CC -1- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
 CC NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
 CC -1- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
 CC ACTIVATION OF NS3.
 CC -1- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
 CC -1- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
 CC ESSENTIAL ROLE IN THE VIRUS REPLICATION.
 CC -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1',
 CC -1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC [RNA] (N).
 CC -1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
 CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1
 CC AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
 CC -1- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY
 CC PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
 CC -1- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
 CC -1- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RL	FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.			
CC	NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION. precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.			
CC	-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral position, Cys or Thr in P1 and Ser or Ala in P1'.			
CC	-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA}(N).			
CC	-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.			
CC	-!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

RESULT 12

S18030

genome polyprotein - hepatitis C virus (isolate JK1)

N:Contains: capsid protein C; envelope protein M; hepatitis C virus genome polyprotein NS5

C:Species: hepatitis C virus

A:Variety: isolate JK1

C>Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 23-Mar-2001

C:Accession: S18030; S33570; A48332; S18029

R:Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.

submitted to the EMBL Data Library, September 1991

A:Description: A whole genome of hepatitis C virus cDNA was isolated from a single patient

A:Reference number: S18028

A:Accession: S18030

A:Molecule type: Genomic RNA

A:Residues: 1-3010 <HON>

A:Cross-references: EMBL:X61596; NID:G59478; PIDN:CAA43793.1; PID:G59479

A:Experimental source: isolate JK1 from an individual

R:Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.

Arch. Virol. 128, 163-169, 1993

A:Title: Sequence analysis of putative structural regions of hepatitis C virus isolated

A:Reference number: A48332; MUID:93119270; PMID:8380322

A:Accession: S33570

A:Molecule type: Genomic RNA

A:Residues: 1-547, 'I', 549-621, 'V', 623-624, 'S', 626-652, 'DL', 655-761, 'T', 763-782 <HON>

A:Cross-references: EMBL:X61591

A>Note: this sequence is inconsistent with the nucleotide translation

A>Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue 320

as Trp, and TTC for residue 771 as Ser

A>Note: sequence extracted from NCBI backbone (NCBI:121747, NCBI:121748)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

|||||

CC region one (HVR1). The HCV E2 protein lacking HVR1 DNA is useful for
 CC producing infectious HCV and chimeric HCV viruses which are useful
 CC for identifying cell lines capable of supporting the replication of
 CC viruses. The infectious HCV and HVR1-chimeric HCV are used in the
 CC production of attenuated or inactivated vaccines which are useful for
 CC treating or preventing HCV in a mammal by immunisation. The host cells
 CC expressing the H77C(HVR1) DNA is useful as an immunogen to stimulate a
 CC protective immune response to HCV. The immunogens are useful for
 CC producing protective antibodies to HCV. The antibodies produced are used
 CC in passive immunoprophylaxis for treatment of diseases caused by HCV in
 CC animals, especially humans. The H77C(HVR1) DNA is also useful in gene
 CC therapy.
 CC Note: The present sequence is not shown in the specification but is
 CC derived from Hepatitis C virus envelope 2 protein lacking hypervariable

 PT Novel nucleic acid molecules that encode hepatitis C virus envelope 2
 PT protein lacking all or part of hypervariable region 1 of envelope
 PT protein, useful as vaccine components for treating or preventing HCV
 PT infections

PS Example; Page -; 80pp; English.
 XX
 CC The present sequence is hepatitis C virus (HCV) E2-634 HVR1 construct
 CC containing the endoplasmic reticulum signal sequence of envelope protein
 CC E1 and carboxy-terminal truncated E2 protein lacking the hypervariable
 CC region one (HVR1) with a replacement of leucine for histidine. The HCV
 CC E2 protein lacking HVR1 DNA is useful for producing infectious HCV and
 CC chimeric HCV viruses which are useful for identifying cell lines
 CC capable of supporting the replication of viruses. The infectious HCV and
 CC HVR1-chimeric HCV are used in the production of attenuated or inactivated
 CC vaccines which are useful for treating or preventing HCV in a mammal by
 CC immunisation. The host cells expressing the H77C(HVR1) DNA is useful as
 CC an immunogen to stimulate a protective immune response to HCV. The
 CC immunogens are useful for producing protective antibodies to HCV. The
 CC antibodies produced are used in passive immunoprophylaxis for treatment
 CC of diseases caused by HCV in animals, especially humans. The H77C(HVR1)
 CC DNA is also useful in gene therapy.
 CC Note: The present sequence is not shown in the specification but is
 CC derived from Hepatitis C virus envelope 2 protein lacking hypervariable
 CC region 1 (AAE00442) referred as SEQ ID NO: 2 and shown in figure 1.

PT New immunogenic polypeptide comprising hepatitis C virus E2 polypeptide
 PT useful for treating hepatitis C virus infection and for providing
 PT immune protection against virus infection -
 PS Claim 4; Fig 6; 84pp; English.
 XX
 CC The invention relates to a secreted polypeptide comprising hepatitis C
 CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
 CC spanning domain so that the E2 polypeptide is capable of secretion into
 CC growth medium when expressed recombinantly in a host cell. The
 CC polypeptide may also lack a portion of its C-terminus. The HCV E2
 CC secreted polypeptide is useful for producing anti-HCV antibodies. A
 CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
 CC HCV infection and for providing immune protection against HCV infection
 CC by administering it to a subject having or at risk of having HCV
 CC infection or in need of protection. The method further comprises
 CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
 CC granulocyte macrophage-colony stimulating factor (GM-CSF) or
 CC gamma-interferon. The polypeptide is useful as a vaccine, and with other
 CC HCV proteins to form a multi-component HCV vaccine for prophylactic or
 CC therapeutic treatment of HCV infection. This sequence represents an N-
 CC and C-terminally truncated HCV delta-delta E2 genotype 1a protein.

 XX
 XX Treating or preventing hepatitis C virus infection in a subject.
 PT involves administering hepatitis C virus envelope protein E2 binding
 PT agents -
 XX
 PS Claim 5; Fig 8; 46pp; English.

XX The present sequence represents a water soluble variant of a Hepatitis C
 CC virus (HCV) envelope E2 protein. Agents that bind to the HCV E2 protein
 CC (such as the human Eo protein), and so inhibit the attachment of HCV onto

CC cells (especially liver cells), are used to treat HCV infections in
 CC mammals, in particular humans. The specification also describes a method
 CC for identifying a compound which can be used for treating or preventing
 CC HCV in a subject and which can inhibit the attachment of HCV onto cells
 CC by inhibiting the binding of HCV envelope E2 protein to a cellular
 CC protein associated with HCV attachment and entry into cells. The method
 CC comprises incubating the compound, HCV envelope E2 protein or its variant
 CC and a cellular protein capable of specifically binding to the HCV E2
 CC protein under suitable reaction conditions; determining the interactions
 CC between HCV envelope E2 protein and cellular protein in the presence and
 CC absence of the compound; and comparing the interaction to identify a
 CC compound which can inhibit the attachment of HCV onto cells.

PT Novel composition comprising a hepatitis C virus antisense
PT polynucleotide which is complementary to or corresponds to a sense
PT strand of the virus genome, and selectively hybridizes to it -
XX
XX Example; Fig 5; 75pp; English.
XX

CC The specification describes a pharmaceutical composition which
CC comprises a hepatitis C virus (HCV) antisense polynucleotide. The
CC HCV is characterized by a positive stranded RNA genome which has
CC 40% homology at the polypeptide level to a HCV polypeptide. The
CC antisense polynucleotide binds to cellular polynucleotides which
CC enhance and/or are required for viral infectivity, replicative
CC ability or chronicity. The antisense polynucleotides may also be
CC designed to bind with high specificity, to be of increased stability,
CC to be stable and to have low toxicity. The composition also comprises
CC an agent which causes viral RNA to be inactive. The composition
CC is used for preventing HCV replication in a system. The present
CC sequence is encoded by a novel HCV cDNA sequence, which is used in the
CC course of the invention.

CC polynucleotides are referred to as a Savine. The synthetic polypeptide is
 CC useful for modulating immune responses preferably directed against a
 CC pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix,
 CC colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone
 CC liver, oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present
 CC sequence is a peptide derived from a parent protein used to
 CC construct a savine of the invention.

XX Monoclonal antibodies specific for hepatitis C virus E2-NS1
 PT antigen - useful for diagnosis and evaluation of HCV infections
 PT and in differentiation studies

XX Example; Page 29; 48pp; English.

XX Immunogenic domains of E2/NS1 region of HCV genome encompassing AAs
 CC 600-720 were mapped with PFSCAN analysis. FAB dimers of IgG
 CC purified from sera of individuals seropositive for antibodies to HCV
 CC proteins were used as the primary antibody for the serological
 CC analysis. Based on the reactivity these sera in EIA, four AA
 CC sequences (AAR32419, R32420, AAR33182, R33183) were identified as
 CC immunogenic domains. Each of these four sequences and an additional
 CC sequence, which was the combination of the two most immunogenic
 CC sequences (AAR33184) were synthesised. Based on the EIA reactivity of

CC a panel of HCV positive sera, peptide AAR33184 was chosen as the
 CC immunogen for the generation of monoclonal antibodies to HCV NS1.

PT assays of HCV
XX
PS Example 7; Page 67; 146pp; English.
XX
CC AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C
CC virus (HCV) E1 and E2 peptides used in competition studies. This
CC sequence represents a synthetic E2 peptide, and corresponds to residues
CC 631-650 of the E2 protein sequence. These sequences are useful for in
CC vitro monitoring of HCV disease, or prognosis of the response to
CC interferon treatment of patients suffering from HCV infection. These
CC sequences compete with the proteins produced by AAT12704-T12709 and
CC AAT12961-T12974, which are included in vectors for the production of
CC recombinant E1, E2, and E1/E2. The recombinant proteins can then be
CC isolated and purified by carrying out a disulphide bond cleavage, or a
CC reduction step with a disulphide bond cleavage agent, after lysis of
CC recombinant host cells. The constructs containing the purified HCV
CC envelope proteins can be used for vaccinating humans against HCV, for in
CC vitro detection of HCV antibodies in a sample, and in a serotyping assay
CC for detecting one or more serological types of HCV present in a
CC biological sample. The constructs can also be immobilised on a solid
CC substrate and incorporated into a reversed phase hybridisation assay for
CC determining the presence or the genotype of HCV. The new purification
CC method preserves the conformation of the recombinantly expressed E1, E2
CC and E1/E2, and eliminates contaminating proteins. Antigens isolated
CC using this method are more reactive with human sera than those isolated
CC by known techniques.

XX New therapeutic vaccine compositions comprising at least one purified
XX recombinant hepatitis C virus (HCV) single or specific oligomeric
XX recombinant envelope protein E1 or E2, useful for immunizing humans
XX from HCV infection
XX
PS The present invention relates to new therapeutic vaccine compositions for
XX inducing hepatitis C virus (HCV)-specific antibodies, comprising a
XX composition containing at least one purified recombinant HCV single or
XX specific oligomeric recombinant envelope proteins selected from an E1 and
XX an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are
XX useful for inducing HCV-specific antibodies or for immunising humans
XX against HCV. The recombinant HCV E1 and/or E2 proteins are useful as
XX vaccines or therapeutics, in HCV screening and confirmatory antibody
XX tests, for raising antibodies, in the preparation of medicament, and for
XX in vitro monitoring of HCV disease or prognosing the response to
XX treatment of patients suffering from HCV infection. The present sequence
XX is a peptide derived from the proteins of the invention.

RT "Phosphorylation of maize RAB-17 protein by casein kinase 2.";
 RL J. Biol. Chem. 266:22510-22514(1991).
 CC -1- DEVELOPMENTAL STAGE: ABA TREATMENT INDUCED THE SYNTHESIS OF RAB-17
 CC IN CALLI, HOWEVER, THE RAB-17 PROTEINS WERE FOUND TO BE HIGHLY
 CC PHOSPHORYLATED ONLY IN EMBRYOS.
 CC -1- INDUCTION: By abscisic acid (ABA) and water stress.
 CC -1- PTM: SERINE IS THE ONLY AMINO ACID WHICH BECOMES PHOSPHORYLATED.
 CC -1- SIMILARITY: BELONGS TO THE PLANT DEHYDRIN FAMILY.

CC -!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
CC -!- HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
CC NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC (RNA) (N).
CC -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
CC LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
CC PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
CC PROTEIN C AND MRNA.
CC -!- SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY_S29.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
